[*Human body - Wikipedia*](#)

The average 70 kg (150 lb) adult human body contains approximately 7×10^{27} atoms and contains at least detectable traces of 60 chemical elements. About 29 of these elements are thought to play an active positive role in life and health in humans. The relative amounts of each element vary by individual, mainly due to differences in the proportion of fat, muscle and bone in their body.

[*Robbins & Cotran Pathologic Basis of Disease*](#)

Human values become a factor when looking at environmental ethics because they are the things that are important to individuals that they then use to evaluate actions or events.
